As you can see in the screenshot below, under the DCSM you can find three groups of time windows. What do these mean? I can't find any information about them online. The DCSM data is only a week ago. Do these represent the cycles of the the LEO, GEO and PEO, or are there other cycles? And how is that possible that some of the individual windows could have empty intervals? What's New in the?

What's new in AutoCAD 2023 Markup Assist: Merge multiple linked components into a single entity. Add complex features, such as headers, footers and titles to the source files of linked drawings, without creating a new, isolated drawing. Incorporate background images into components, such as colors, shades, borders and drawing axes, without creating a separate drawing. Incorporate objects and linked drawings into multi-sheet setups without additional drawing steps. Apply smart defaults to typeset text, such as numbering and metric measurements. Use the new Automatic Calculation Rules for numbers and sizes in multi-sheet setups. Use color icons to format text and cell and table borders. Change the format of references to external files or Web sites. Groups and Layers: Save groups for new layouts. Link to multiple drawings and directly apply the layout to group parts. Save and apply groups to drawings in the background to keep your drawings organized. Apply linked groups to objects that are not part of a drawing, such as sheets or drawings that are not linked to a specific drawing. Add and edit objects to groups. You can also use parameters to control how different objects are added to a group. Apply sheet styles to sheets in a group. Apply named styles to groups for a consistent appearance in layouts. Group transparent objects, such as clouds and gradients, by creating a list of separate layers for each drawing. Create comments for objects. Arrange groups for the best appearance. Create an array of groups from various layouts or collections and edit the appearance of the groups with filters and frame styles. Edit groups and their parts by creating groups of parts that are grouped by layers, properties and categories. Select objects and create groups for the most common shapes in a drawing. The groups are stored in memory so that they can be applied to multiple drawings, even when linked to external sources. Use the contents of groups to automate custom positioning. Select an object in a group and create a custom x, y and rotation for the selected object relative to other objects in the group. What's new in AutoCAD 2023 Layers: Import layers from linked drawings. Link multiple drawings and apply one of the layers to new drawings. Create groups of layers that you use in various layouts and collections. Incorporate linked
