## AutoCAD Crack + With Keygen

My mother has an immense collection of all the Japanese pornographic magazines and movies that were recently destroyed. She's been collecting them for years. Now, I'm in charge of preserving them. I find the raw mags and go through them, replacing the glossy pages with real cardboard. I carefully cut out anything that seems too risqué, then glue them back into the magazine. I've just started with the films, but I'll be putting the mags in storage as well. She's a very private person so it's a bit of a shock when I'm sending this to her.Q: How can I optimize my method to find an item in a list based on a property of the item? I have a method that works like this: public T Search(T item, string text) { foreach (T item in items) { if (item.Text.Equals(text)) { return item; } } return null; } The problem with this is that if the collection is empty, there will be no search, and that returns null. Is there any way to optimize the method so that if the collection is empty, it doesn't even bother searching? I'm thinking something like this, but it doesn't work: public T Search(T item, string text) { return items.Where(item.Text.Equals(text)).FirstOrDefault(); } A: Try this public T Search(T item, string text) { var data = items.Where(item => item.Text.Equals(text)).FirstOrDefault(); if (data!=null) return data; return null; } A: Use a predicate: public T Search(T item, string text) { return items.FirstOrDefault(item => item.Text.Equals(text)); } It will return the first element that matches the condition. If you know that there will never be more than one

## What's New In AutoCAD?
