The AutoCAD family includes several software products that together make up a complete solution for AutoCAD, such as AutoCAD LT, AutoCAD MEP, AutoCAD Architecture, and AutoCAD Map 3D. A release of AutoCAD in 1984 included the Autodesk ObjectARX component, which allows CAD components to be used within non-AutoCAD applications. Since its introduction, AutoCAD has become a popular professional tool, with AutoCAD users being the third-largest CAD group in the United States behind the FDM/FFB and 2D drafting groups. AutoCAD is estimated to be used by more than 10 million users worldwide. AutoCAD can also be used as a standalone software tool, though is more frequently used within the Autodesk software suite. AutoCAD includes a function-based interface for the user and is intended to promote new levels of autonomy in the operator of a CAD application. It works for all types of companies, mediums and projects. It is cross platform (iOS, Android and Windows versions), easy to learn and has free, paid and enterprise version. 3D drawing with it. CAD platforms AutoCAD is available on Windows and macOS. The Windows version is delivered as a software distribution, a download, or as a combination of both (AutoCAD as an online service) called the AutoCAD Online Experience. Q: Generate a symmetric, non-clustered, and regular, primary key for table in SQL Server? We have some tables that need to be a specific way. The main keys are not unique, and are regular, but there are a lot of records, and they're not clustered. Basically, the big table is a staging area for real-time inserts and updates, but they have no relation to the real-world, but we have a chance to update any rows that match the criteria. We have a lot of time in this, but unfortunately our DBA is in the middle of a vacation, and we can't create the keys until he returns. I'd like to know: 1) How can I generate a non-clustered and regular primary key in SQL Server? 2) Does this impose any additional restrictions on data in any way? A: Ok, so I've created a new column in the table, as a uniqueidentifier and int from this. I'm not sure if it's any different than the default auto incrementing guid, but it will save a lot of time to go through and replace all the unique identifiers that are already in place. It's a pain, but if I have to get my hands dirty I can do that faster than waiting for a DBA to return. (Thanks to @Yasin for the help) Specific deficits in
