The study, conducted by researchers at the University of California, Berkeley, appeared to show that children who grow up in homes with a high level of education are less likely to develop depression and anxiety. Some experts have suggested that early stress from having a parent with a low level of education is linked to poor cognitive and academic development. The new study suggests that the issue of parental education is even more relevant to brain health than was previously thought. In her 2011 book "Maternal Deprivation: The Impact on Child Development," Martha Gilligan, a professor of sociology at the University of Maryland, listed "the effects of socioeconomic disadvantages on the brain" among the "major changes in children's brains" due to maternal deprivation. Many of those disadvantages are tied to the number of years a woman has spent in school. "It's a very promising area of study," said David Williams, a professor of psychology at the University of Massachusetts at Amherst. "It's not just the difference between a parent who finished a master's degree and a parent who didn't go to college. There's the educational level of the mother and the educational level of the father."Q: SQL - How to prevent overwriting data already there? I'm looking for a way to prevent overwriting
