AutoCAD application programming interface (API) The AutoCAD application programming interface (API) enables the development of applications for AutoCAD. The API exposes functions that are used to interact with AutoCAD and to view and change drawing objects. External data (XData) External data is information outside of the drawing file, such as coordinates for specific tasks. External data can be used to construct a three-dimensional model, from drawings. AutoCAD supports input data in the form of XData. Graphics (Image) The Graphics functions work with vectors, raster images, and bitmapped images (that is, bitmaps). They include creating and editing images, displaying images, and drawing objects. For example, the Rectangle (R) and Line (L) commands can be used to construct a rectangle on the screen. Architectural drawing is created with the Arc command, which is analogous to the Arc command in AutoCAD LT. The Arc command is used to draw a continuous line and a series of arcs. The Line command is used to draw a line. The Arc function is used to draw an arc. The Circle function is used to draw a circle. The Ellipse function is used to draw an ellipse. The Decimal function is used to create a decimal point, as shown in Figure: A line is drawn between any two given points on a plot. The points are specified by a decimal value. The Rectangle function is used to create a rectangle. The Record function is used to capture drawing information that is then available as part of the drawing file. Layout Layout is the process of organizing various design components (assemblies, lines, angles, dimensions, etc.) to create a drawing. The object level The object level includes the objects of the drawing. Objects Objects are the most fundamental unit in a drawing. Object types include drawing objects, dimensions, annotations, layers, layouts, and components. Each object can have a name, an indicator for editing, a type, its class and the type of its content. An object can be related to one or more other objects. Layers Layers are used to manage groups of objects and properties. The default layer contains drawing objects. The Active layer contains the objects that are currently displayed on the screen. A layer can be used to group layers, thus creating a hierarchical display a1d647c40b
