AutoCAD is an object-modeling application, meaning it is used to design buildings, automobiles, bridges, and other objects. The program works by showing the user a 2D representation of an object, and then the user is able to draw the object using the keyboard or other input device. The 2D drawing is called a "sketch" or "draft." In AutoCAD, a sketch is an "object," which means it has its own icon and properties that are stored in a database. As a user works, new sketches are saved, and old sketches are loaded and reused. Once a sketch has been finished, it is organized into a "component." Components are essentially containers, and they can be loaded into and saved from the drawing. The objects used in a drawing are saved in a component called the "model." At any point in the creation process, a designer can save the object as an "Archive." Once a component has been created and saved, it can be shared with other users. Another user can view the component in the same window in which the sketch was created or in

Markup Assist will preview your work before you commit it to the design environment. "Preview" is a way to preview a drawing after you have created it. We call this functionality Markup Assist, because it is used in the Markup Assistant. If you mark a drawing with a shape (or any markup, such as dimensions) before you commit the change, the Markup Assistant can "watch" the drawing in the background and preview the changes you make. This works in two ways: You can click the "preview" button on the command line (CMDO or CADOPT) to preview your work You can choose a drawing, and the Markup Assistant can preview the changes you make in that drawing before you commit the changes to the design environment You can see an example of both "Preview" functionality and Markup Assist at the end of this presentation. Design and rendering assistance: Dynamic dimensioning: The drawing environment gets smarter over time. Dynamic dimensioning will automatically fit dimensions into the dimension bar, and dynamically adjust to the geometry of the drawing. Integrated views: When you have multiple images or sections in a drawing, it is important to show and hide what you need. You can do this with new views in AutoCAD 2023. The View Manager will display all of the views at once, so you will see all of the views in the same viewport. This viewport can be resized to show only the views you want to see. To demonstrate Dynamic Dimensioning: Add a section. Add a text box. Add a dashed line (which is a dynamic dimension). Add a text box to the upper right-hand corner of the dotted line. Add an image. Move the text box off the dashed line (so the dotted line is no longer next to the text box). Adjust the view so you can see the text box. Pan the viewport around so you can see the image as well. Double-click the dashed line to dynamically adjust the dotted line to fit the drawing. If the text box was off the dashed line before, the dotted line will resize to show the text box again. Shadows: Shadows in AutoCAD are much more intuitive and easy to use. Shadows on strokes are no longer disabled by default, and shadows in
