DNA replication, a highly regulated process that ensures that only one copy of a DNA molecule is made from that of its parental template, has been a major focus of biomedical research for decades. Although the processes involved in replication are relatively well understood in bacteria and eukaryotes, little is known about DNA replication in Archaea. Of the 570 genera within the archaeal domain, only a handful possess replicative DNA polymerases. The most studied archaeal polymerase, PolC (a.k.a. T5 polymerase), is encoded by a single gene in Thermococcus and Pyrococcus, and is a homolog of eukaryotic DNA polymerase delta. This application outlines experiments that test specific hypotheses regarding the origin and function of replicative DNA polymerases in Archaea. The Specific Aims include: 1) exploring the range and natural variation of Pyrococcus and Thermococcus PolC polymerases, 2) characterizing PolC-related polymerases in Pyrococcus species, 3) exploring the function of PolC-related polymerases in Pyrococcus, 4) identifying the function of archaeal PolC polymerases in Pyrococcus and Thermococcus, and 5) elucidating the function of PolC-related polymerases from Pyrococcus furiosus. Our studies are an important first step in establishing the genetic and functional
