Watch some of the many videos that focus on using Photoshop. Chances are that you'll find one that can help you master the software. A JPEG is a full-color digital file containing an array of dots that have been arranged in a grid. In theory, you can place as many of those dots onto your computer's screen as you want, with the result being a photograph. The number of dots represents the amount of toner that's deposited onto a piece of paper. In reality, though, the number of dots doesn't really matter — except when you get hundreds of thousands of them. In fact, some point-and-shoot cameras and older scanners actually measure the toner's density, and then adjust the way they scan to reflect that amount. The result, of course, is that the scanned image loses details and the color tones become a bit bland. The JPEG file format is what all image files are written in. Unfortunately, the format isn't 100 percent friendly to users. You can read more about JPEG in the upcoming "JPEG Files: Save Yourself Some Trouble" section. The major advantage of JPEG files for your computer is that they can be as little as 7KB each (the minimum size) while still containing all the color information that you need. TIFF files, on the other hand, can be as large as 300MB each and are the standard image format. Unfortunately, JPEG files typically have a file size that's bigger than other image formats, so you're paying a premium in file space for that extra color data. JPEG Files: Save Yourself Some Trouble The JPEG standard's most significant shortcoming is that it only supports grayscale images. That means if you convert your photographs or images to a color format, you no longer have all of the available toner-determined color information. As a result, the look of the image changes in a way that not many people can recognize. To avoid such problems, many programs like the free Adobe Photoshop Elements offer you the opportunity to convert color images into a grayscale format. You can convert an image to grayscale by simply choosing File⇒Convert⇒Grayscale from the menu. Although you do lose some color resolution, at least the grayscale format provides for more usable toner information. If you have a Photoshop plug-in (a company's version of a program's standard utility), you might not be able

, health and welfare issues. UNITED NATIONS, May 3 (Xinhua) -- The General Assembly is expecting the arrival of a larger number of Syrian delegates after the increase of the number of Syrian nationals' visas to operate in the United States under the Visa Waiver Program. A total of 533 Syrians were issued entry visas for visiting to the United States, according to the U.N. Office of the Coordinator for Humanitarian Aid (OCHA). Adm. Gary Roughead, the head of United Nations Peacekeeping Operations (UNPO) for the period of 2014-2015, recently told reporters in Paris that there are about 500 Syrian national's holding entry visas for the United States. Before, a number of Syrian nationals were admitted to the United States by using the Visitor Waiver Program (VWP), but the United States had to end the VWP with Syria in June 2013. The French magazine "Le Point" had recently published a report that it could be very likely that Russia would veto any U.N. measure against Syria during the ongoing United Nations peace conference on Syria in Geneva. Russian Deputy U.N. Ambassador Gennady Gatilov told the Associated Press that Moscow will insist that any U.N. Security Council resolution must be backed by international peacekeeping force. In an interview with the Syrian peace envoy, Bashar al-Jaafari, on Friday, Iranian Deputy Foreign Minister Hossein Amir-Abdollahian has rejected any suggestion by the United States and its allies that the Syrian government is responsible for the nerve gas attack in Damascus on Aug. 21. Iran is not even engaged in international chemical weapons inspections, so there is no need for it to be involved in such procedures." Amir-Abdollahian told the Iranian Tasnim news agency. "We have no way of knowing whether there is or is not," he added. The nerve agent Sarin allegedly used in Syria bears a striking resemblance to the sarin used in a devastating gas attack in the Syrian town of Khan Sheikhoun in April, allegedly carried out by the country's military. That chemical attack, which killed hundreds of people, was attributed to the Syrian government by Western and Arab states, but the Russian government has repeatedly said that the Syrian army had no role in it. On July 15, Russia was preparing to bring a draft resolution to the Security Council that would pave the way for U.

Q: Explicitly constructing Composition of Fractal Maps Does there exist any way of explicitly constructing composition of two renormalization fractal maps? A: You can represent a renormalization as a list of zeros and ones that is infinite in both directions. This makes it a straightforward exercise to write down an algorithm to get a composition of two renormalization functions from one to the other. Here is what the first step would look like: var recurse = function (one, two): if (one.length == 0): return two if (two.length == 0): return one var zeros = new Array(0, 0, 0, 0, 0) var ones = new Array(0, 0, 0, 0, 0) for (let i = 1; i
