$$\int \frac{1}{9} \cos(2\pi x^2) dx$$
 we know that $u=2\pi x^2$, $du=2\pi x dx$, $-2\pi x \leq u \leq 2\pi x$ so
$$\int \frac{1}{9} \cos(2\pi x^2) dx = \int \frac{1}{3} \sin(2\pi x) dx$$
 how to continue? A: Hint: If we try the substitution $u=2\pi x^2$, we see that
$$\int \frac{1}{3} \sin(2\pi x) dx = \frac{1}{3} \int \frac{\sin(u)}{\sqrt{u}} \sqrt{u} du.$$
 A dynamic model of the molecular mechanisms for smooth muscle relaxation. The membrane currents associated with contraction of smooth muscle tissue are well characterized, but how they contribute to relaxation is less clear. Theoretical models of the underlying molecular mechanisms for smooth muscle relaxation have been based on the Crenalow hypothesis, which suggests that smooth muscle relaxation is due to Ca²⁺-dependent inhibition of L-type Ca²⁺ currents. We tested this hypothesis by simulation of the rate of relaxation in response to membrane current clamp stimulation. We found that Ca²⁺-activated K⁺ currents were the primary factor inhibiting
