When you do BERT fine tuning you want to stop at 20 steps. Why? I understand that there are some metrics that you want to improve. But why stop after 20 steps? Is there something else you want to improve? The sentiment analysis can be improved by adding a new class. The cosine similarity can be improved by adding more embeddings. The accuracy of the single label can be improved by adding more layers. Even if these are useful it would be better if you are going to use it for more than 10 steps. A: BERT has been modified from VGG style networks with fully connected layers. One of the downside of these networks is that they go to infinity while training. So in the pre-trained state, BERT has the same weights for each fully connected layers. As a consequence, you can just count the number of layers to extract the number of fully connected layers for a net of a certain size. /* Copyright The Kubernetes Authors.
